No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The pattitis C virus gene - used for prodn. of polynuclectide probes, polypeptide(s) and antibodies for diagnosis, prevention and treatment of infection.

The sequence is the peptide encoded by the hepatitis C virus care used to diagnose HCV-induced NANBH, to raise antibodies for immunoassay or treatment, or to produce vaccines.

The region shown overlaps with clone 25c.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        4; Gaps

New insecticidal Bacillus thuringiensis toxins - useful for controlling lepidopteran pests, especially Ostrinia nubilalis, Heliothis virescens and Helicoverpa zea controlling lepidopteran pests, especially Ostrinia nubilalis, Fages 36-38; 50pp; Engdish.

This is the amino acid sequence of a novel Bacillus thuringiensis toxin used in the method of the invention, to control lepidopteran pests. The new toxins are useful as pesticides, especially for the control of Strinia nubilalis, Heliothis virescens, and Helicoverpa zea. The polynucleotide coding sequences are useful for recombinant expression of the toxins and the primers, together with probes derived from the new sequences, are useful for the identification and characterisation of novel genes that encode pesticidal toxins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                4

Purified hepatitis C virus

and associated nucleic acids and polypeptide(s)

claim 13: Figure 18: 139pp: English.

It is the sequence encoded in the hepatitis C virus (HCV) cDNA insert in clone 14c. Tag a - the region of overlap with the HCV antigen encoded in clone 25c. It is an epitope which could be used as immunoassay reagents and vaccines and to generate antibodies useful in diagnosis and passive immunotherapy for HCV infection/non-A, non-B hepatitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     insert in clone 14c.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         amplification using nested primers resulted in 7 adjacent HCV DNA fragments which could be assembled into a full-length sequence. The DNA sequence was determined and translated into the genomic amino acid sequence. Comparison of the LG genomic amino acid sequence comparison of the LG genomic amino acid sequence with that from HCV-1 showed 134 amino acid differences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                       New plasmid pHCV-162 is a mammalian expression systems for HCVD proteins - useful for diagnosing HCV infection and as vaccines for preventing HCV infection and as vaccines Example 1; page 39-49; 100pp; English.

RNA was isolated from the plasma of a HCV seropositive human (designated "LG") and cDNA was prepared from it. The CDNA was PCR amplified using specific primers with sequences based on the prototype HCV-1 CDNA sequence (GENBANK M62321). Further
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ..

This represents a hepatitis E virus (HEV) open reading frame (ORF)-1
Protein encoded by a DNA sequence designated SAR-55. SAR-55 also encodes
HEV ORF-2 and ORF-3 proteins. A host organism transformed or transfected
with a recombinant expression vector containing the SAR-55 nucleic acid
can be used to produce the HEV proteins, especially ORF-2 protein. The
recombinant HEV proteins can be used as diagnostic agents and as vaccines
for use against HEV infection. The detection of antibodies specific for
HEV can be used for the diagnosts of infection and diseases caused by
HEV, and for monitoring the progression of such disease. Such methods are
also useful for monitoring the efficacy of therapeutic agents during the
course of treatment of HEV infection and disease in a mammal. The

controlling lepidopteran pests, especially Ostrinia nubilalis, Heliothis virescens and Helicoverpa zea (Laim Hi, Pages 32.34; 50pp; English.

This is the amino acid sequence of a novel Bacillus thuringiensis toxin used in the method of the invention, to control lepidopteran pests. The new toxins are useful as pesticides, especially for the control of Ostrinia nubilalis, Heliothis virescens, and Helicoverpa zea. The polynucleotide coding sequences are useful for recombinant expression of the toxins and the primers, together with probes derived from the me sequences, are useful for the identification and characterisation of novel genes that encode pesticidal toxins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ë,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Disciosure; Page 15; 117pp; English.

A positive clone ET1.1 was identified in a library prepared from bile of cynomolgus monkeys infected with the Burma strain of ET-NANB. Both strands of ET1.1 were sequenced. Identity of the sequence with sequences in etiologic agents has been confirmed by locating a similar sequence in a viral strain isolated in Burma. This protein is sencoded by the longest ORF (ORF 1) of the Burma strain. Sequence 1693 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       572 frtsfødgavletngperhnlsfdasgstmaagpfsltyaasaaglevryvaagldhrav 631

Disclosure; Pages 9-13, 121pp; English.

The present sequence is the protein prod. of ORF-1 from the hepatitis E virus (HEV) strain SAR-55, which was implicated in an enertically transmitted non-A, non-B hepatitis in Pakistan. The protein encoded by the structural region of the virus (i.e. ORF-2), which is capable of forming HEV like particles, is useful for the detection of HEV antibodies (pref. 196 or 19M) in blood, plasma, crebbrospinal fluid, tissue, urine or pleural fluid. The protein, and anti-HEV antibodies generated using the protein, can also be used in vaccines for immunishing an animmal against HEV infection. The protein is identified as a band of greater than

Claim 22; Columns 57-66; 47pp; English.

Wa0196-98 are encoded by the genome of the Burma strain of enterically transmitted non A non B hepatitis virus (ET-NANB) (hepatitis E virus (HEV)). The specification describes an isolated protein which is specifically immunoreactive with antibodies present in individuals infected with HEV and encoded by a sequence contained in an open reading frame (ORF) of an HEV genome. The genome has a sequence that is more than 70% identical to the ORF; sequence from Burma HEV isolate. The protein is used as a vaccine and a diagnostic probe for ET-NANB.
                                                                                                                                                                                                                                                                                                                                                                      9

Disclosure, Columns 55-64; 45pp; English.
W71209-11 represent the proteins encoded by the open reading frames W71209-11 represent the proteins encoded by the open reading frames transmitted nonA/nonB viral hepatitis agent (ET-NANB). The nucleic acid sequence may be used for identifying and sequencing the entire viral agent (also referred to as EFF), detecting ET-NANB in infected samples, e.g. by specific amplification of virus-derived DN sequences and for producing recombinant viral proteins for use in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      64

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   30-0c1-1998 (first entry)
Protein encoded by ORF 1 of the Burmese isolate of ET-NANB.
Enterically transmitted nonA/nonB hepatitis virus; identification;
HEV; ET-NANB; detection; vaccine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Hepatitis E virus DNA - useful for e.g. virus detection and viral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                50 kD following SDS-PAGE of cell lysates of insect cells infected with a HEV ORF-2 contg. baculovirus, i.e. the claimed recombinant expression vectors pPIC9-1779, -1780 and -1781.

This is the amino acid sequence of a novel Bacillus thuringiensis toxin used in the method of the invention, to control lepidopteran pests. The new toxins are useful as pesticides, especially for the control of Ostrinia nubilalis, Heliothis virescens, and Helicoverpa zea. The polynucleotide coding sequences are useful for recombinant expression of the toxins and the primers, together with probes derived from the new sequences, are useful for the identification and characterisation of novel genes that encode pesticidal toxins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     02-DEC-1998 (first entry)
Amino acid sequence of lepidoteran-active HD573 toxin.
HD573 toxin: PCR: primer: amplification; Bacillus thuringiensis; probe; lepidoptera; pest; pesticide; Ostrinia nubilalis; Heliothis virescens; Helicoverpa zea; hybridisation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                Hepatitis E virus hollow particle poly:peptide(s) and nucleic acids encoding it - useful for more accurate detection of HEV in samples, using immuno-assays and nucleic acid hybridisation [Claim 10; Page 17-24; 29pp; Japanese. This sequence represents a Hepatitis E viral hollow particle protein. This sequence represents a Hepatitis E viral hollow particle protein. This polypeptides can be used to raise antibodies to detect HEV infection in samples, e.g. by immuno-assay based techniques, and the nucleic acid can be used for the same in nucleic acid hybridisation assays. The polypeptides and nucleic acids allow more accurate detection of HEV than previously possible.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              frtsfydgayleangperynlsfdasgstmaagpfsptyaasaaglevryvaagldhrav 631

Purified hepatitis E strain SAR-55 virus - used to develop prods.

To use in detection, diagnosis, vaccines and therapy of hepatitis E virus infection, diagnosis, vaccines and therapy of hepatitis E virus infection.

The sequences given in R51264-66 are encoded by the hepatitis E virus infection in R51264-66 are encoded by the hepatitis E virus infection in R51264-66 are encoded by the hepatitis E virus infective antibodies upon injection into a mammal that would serve to protect the mammal upon challenge with wild type HEV. The proteins can be used for detection and diagnosis of HEV infection. The HEV SAR-55 CDNA was isolated from primates innoculated with stool successive in the stool served in the stool served successive in the served su

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Gaps New proteins derived from T4 phage tail fibre proteins - that can self assemble into nano-structure(s), useful as filters etc, also corresponding DNA
claim 7; Fig 7; Bipp; English.
A protein (R97371) of unspecified function is the product of open reading frame X of the tail fibre protein gene region (see also 1729053) of phage T4. This gene region also includes open reading frames for tail fibre proteins (see also R97370 and R97372-74).
Tail fibre proteins (active or modified) can be produced in large quantities in microbial cells and used as building blocks of strong, Stable nanostructures. 56 ö Length 65; Match 54.4%; Score 300; DB 19; Length 65 Local Similarity 82.1%; Pred. Mean 34.913; Variance 62.861; scale 0.555 Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

ALIGNMENTS

RESULT

New proteins derived from T4 phage tail fibre proteins - that can self assemble into nano-structure(s), useful as filters etc, also corresponding DNA
Claim 7: Fig 7: 83pp; English.
A protein (R97371) of unspecified function is the product of open reading frame X of the tail fibre protein gene region (see also frames for tail fibre proteins (see also R97370 and R97372-74).
Tail fibre proteins (ace also R97370 and R97372-74).
Tail fibre proteins (ace also R97370 and R97372-74).
Tail fibre proteins (ace also R97370 and R97372-74). 07-JAN-1997 (first entry).

Phage T4 ORFX gene product. gp34.

Phage T4; tail fibre protein; nanotechnology; nano-structure; filter; molecular sieve.

Claim 10: Page 17-24: 29pp: Japanese.

This sequence represents a Hepatitis E viral hollow particle protein. This polypeptides can be used to raise antibodies to detect HEV infection in samples, e.g. by immuno-assay based techniques, and the nucleic acid can be used for the same in nucleic acid hybridisation assays. The polypeptides and nucleic acids allow more accurate detection of HEV than previously possible.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    572 frtsfvdgavleangperynlsfdasqstmaagpfsptyaasaaglevryvaagldhrav 631
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The lichenase gene from Bacillus subtilis Y-25 is used for transforming Bacillus hosts so that they show increased lichenase expression. The recombinant lichenase enzyme produced by the transformants is useful in beer production for decomposing beta-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Replicable plasmidic expression vector - for transformation of Bacillus to direct expression of poly:peptide
Disclosure; Fig 4; 37pp; English.
The inventors claim a vector comprising a replicable plasmid containing the promoter and regulatory region of a gene selected from apr[Bamp] and npr[Bamp], for transformation of Bacillus to direct expression of polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           240 issesgkyvlrdlskptgtqiitydlqnreynlp-gtlvssttnqfttssgraa 292 :|: : | | : : | | : : | | : : : | | 36 LSTAGPSYV-KFQDNPVGSQTFSAGLHLRVFDPSTGALVDSKSYAFSTSNDTTS 88

Amino acid sequence of lepidoteran-active HD573 toxin.
HD573 toxin: PCR: priner; amplification; Bacillus thuringiensis; probe; lepidoptera; pest; pesticide; Ostrinia nubilalis; Heliothis virescens; Helicoverpa zea; hybridisation.
Bacillus thuringiensis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New insecticidal Bacillus thuringiensis toxins - useful for controlling lepidopteran pests, especially Ostrinia nubilalis, Heliothis virescens and Heliotoverpa zea Claim 14: Pages 28-30: 50pp; English.
This is the amino acid sequence of a novel Bacillus thuringiensis toxin used in the method of the invention, to control lepidopteran pests. The new toxins are useful as pesticides, especially for the control of Ostrinia nubilalis, Heliothis virescens, and Heliotoverpa zea. The polynucleotide coding sequences are useful for recombinant expression of the toxins and the primers, together with probes derived from the new sequences, are useful for the identification and characterisation of novel genes that encode pesticidal toxins.

New thermostable (1,3-1,4)-beta-glucanase - prepd. using hybrid gene obtd. using Bacillus amyloliquefaciens and B.macerans genes Disclosure; page 26; 84pp; Pagilsh.

This hybrid protein is encoded by the beta-glucanase-H1 gene. This hybrid protein is encoded by the beta-glucanase-H1 gene. Following processing of the signal peptide the mature protein is produced, comprising the amino terminus of the amyloliquefaciens beta-glucanase and the carboxyl-terminal half of the B.macerans beta-glucanase. This hybrid protein is thermostable and hydrolyses beta-glucanase. This hybrid protein is thermostable and hydrolyses beta-glucan and hydrolys
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Disclosure: Columns 55-64; 45pp; English.
W71209-11 represent the proteins encoded by the open reading frames W71209-11 represent the proteins encoded by the open reading frames transmitted nonA/nonB viral hepatitis agent (ET-NANE). The nucleic acid sequence may be used for identifying and sequencing the entire viral agent (also referred to as HEV). detecting ET-NANE in infected samples, e.g. by specific amplification of virus-derived DNA sequences and for producing recombinant viral proteins for use in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

The present sequence is the protein prod. of ORF-1 from the hepatitis E virus (HEV) strain SAR-55, which was implicated in an entically transmitted non-A, non-B hepatitis in Pakistan. The protein encoded by the structural region of the virus (i.e. ORF-2), which is capable of forming HEV like particles, is useful for the protein ond anti-HEV antibodies (pref. 196 or 19M) in blood, plasma, care, cerebrospinal fluid, tissue, urine or pleural fluid. The protein and anti-HEV antibodies generated using the protein, can also be used in vaccines for immunising an animal against HEV infection. The protein is identified as a band of greater than 50 kD following SDS-PAGE of cell lysates of insect cells infected with a HEV OKF-2 conty, baculovirus, i.e. the claimed recombinant

                                                                                                                                                                                                                                                     for use in detection, diagnosis, vaccines and therapy of hepatitis E virus infection Disclosure; Page 57-62: 114pp: English.

The sequences given in R51264-66 are encoded by the hepatitis E virus (HEV) strain SAR-55. The CDNA sequence contains three open reading frames (OREs). These proteins can be used to stimulate the production of protective antibodies upon injection into a mammal that would serve to protect the mammal upon challenge with wild type HEV. The proteins can be used for detection and diagnosis of HEV infection. The HEV SAR-55 CDNA was isolated from primates innoculated with stool

New insecticidal Bacillus thuringlensis toxins - useful for controlling lepidopteran pests, especially Ostrinia nubilalis, Hellothis virescens and Helicoverpa zea Claim 14; Pages 32-34; 50pp; English.

This is the amino acid sequence of a novel Bacillus thuringlensis toxin used in the method of the invention, to control lepidopteran pests. The new toxins are useful as pesticides, especially for the control of Ostrinia nubilalis, Heliothis virescens, and Helicoverpa zea. The polynucleotide coding sequences are useful for recombinant expression of the toxins and the primers, together with probes derived from the new sequences, are useful for the identification and characterisation of novel genes that encode pesticidal toxins.
                             02-DEC-1998 (first entry)
Amino acid sequence of lepidoteran-active HD525 toxin.
HD525 toxin, PCR; primer; amplification; Bacillus thuringlensis; probe; lepidoptera; pest; pesticide; Ostrinia nubilalis; Heliothis virescens; Helicoverpa zea; hybridisation.
Bacillus thuringlensis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               511 fisekfgngsdslrfegsnttarytlrgngnsynlylrvssignstirvtingrvytas 569

Wally 6-98 are encoded by the genome of the Burma strain of wally 6-98 are encoded by the genome of the Burma strain of enterically transmitted non A non B hepatitis virus (ET-NANB) (hepatitis E virus (HEV)). The specification describes an isolated protein which is specifically immunoreactive with antibodiase present in individuals infected with HEV and encoded by a sequence contained in an open reading frame (ORF) of an HEV genome. The genome has a sequence that is more than 70% identical to the ORFI sequence from Burma HEV isolate. The protein is used as a vaccine and a diagnostic probe for ET-NANB.

and development.

Example 5: Fig 12: 149pp; English.

This sequence is encoded by the Arabidopsis thaliana ethylene response. This sequence is encoded by the Arabidopsis thaliana ethylene response. (ETR) gene, designated OITR. The ETR gene is used in the antisense expression construct of the invention, which also contains a promoter. Expression of the construct in a plant cell results in a decreased production of plants which have a decrease in physiological responses to the presence of ethylene. Ethylene is a plant hormone which is involved in various positive plant controls e.g. growth, development and fruit ripening, and is also induced by environmental stresses wounding, pathogenic infection and flooding. Controllable, inducible expression of ethylene antisense constructs in transformed plant cells allows
                                                                                                                                                                                                                                                                                                                                                                                                        C'JAN-1959 (LIESC-EULY)

A thaliana ethylene response protein OITR.

Ethylene response gene; ETR; plant hormone; plant growth modulation;

Mabidopsis thaliana.

Saddewelopment control; fruit ripening.

Mean 21.936; Variance 22.856; scale 0.960 Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

FANG G.W., ALLISON R.F., ZAMBOLIM E.M., MAXWELL D.P., GILBERTSON R.L.;

"The complete nuclectide sequence and genome organization of bean common mosalc virus (NL3 strain).";

VIRUS RES. 39:13-23(1995).

- I- FUNCTION: HILPER COMPONENT-PROTEINASE IS REQUIRED FOR APHID TRANSMISSION AND ALSO HAS PROTEOLYTIC ACTIVITY.

- I- FUNCTION: CYTOPLASMIC INCLUSION PROTEIN HAS HELICASE ACTIVITY. IT MAY BE INVOLVED IN REPLICATION PROTEIN HAS HELICASE ACTIVITY. IT DAYS BE INVOLVED IN REPLICATION PROTEIN HAS HELICASE ACTIVITY.

- I- FUNCTION: WUCLEAR INCLUSION PROTEIN HAS PROTEOLYTIC ACTIVITY.

- I- PUNCTION: WUCLEAR INCLUSION PROTEIN HAS PROTEOLYTIC ACTIVITY.

- I- PUNCTION: WUCLEAR INCLUSION PROTEIN HAS PROTEOLYTIC PROCESSING RESULTING IN THE PRODUCTION OF AT LEAST EIGHT INDIVIDUAL PROTEINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This SWISS-PROT entry is copyright. Mean 37.051; Variance 67.149; scale 0.552 Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
